📊 ADVANCED EXCEL PROJECT – JOB MARKET INTELLIGENCE ANALYSIS

SCENARIO:

Click on **below** 👇 **link** (just on JOB_Market) to Download **DataSet**…..

JOB_Market

You are hired as a **Data Analyst in an HR Analytics Company**.
Your task is to analyze the **JOB_Market** dataset (**1500 records**) and build insights for:

- Hiring Strategy
- Salary Benchmarking
- Demand Forecasting
- Remote Work Trends
- AI Job Market Growth

S.No.	Problem Statement
1	HR wants to know **total number of jobs in USA that are Fully Remote and belong to AI Engineering category**
2	Find **total salary payout for jobs in Finance industry where demand score > 90**
3	Calculate **average salary of Senior roles in USA with remote-friendly jobs**
4	Identify **highest salary offered in Technology industry for jobs requiring Python skill**
5	Count **jobs where experience > 5 years AND salary > $150K AND remote = Yes**
6	HR wants to extract a **dynamic list of all unique job categories available**
7	Sort all jobs based on **highest salary first dynamically**
8	Filter all jobs where **Demand Score > 90 AND Growth > 20%**
9	Generate list of **Top 10 highest paying jobs dynamically**
10	HR wants **all Remote jobs in USA displayed dynamically**
11	Create a **dropdown-based lookup system** to fetch job details by Job ID
12	Compare **two Job IDs and return their salaries side by side**
13	Create logic: **"High Demand Premium Job" if Salary >200K AND Demand >90**
14	Categorize jobs into **High / Medium / Low growth using demand growth %**
15	Identify **Risk Jobs where Growth <10% OR Benefits <6**
16	Create flag: **Non-Remote Friendly jobs using NOT function**
17	Build a Pivot Table showing **Average Salary by Job Category**
18	Build Pivot showing **Count of Jobs by Country and Remote Type**
19	Create Pivot Chart showing **Salary distribution across Experience Levels**
20	Create Pie Chart showing **Job distribution by Industry**

21	Add **Slicers for Country, Job Category, Remote Work** to control all pivots
22	Calculate **Total Salary visible after applying slicers dynamically**
23	Calculate **Average Salary based on slicer selection only**
24	Count **visible jobs after slicer filter applied**
25	Create a **dashboard KPI card: Total Jobs, Avg Salary, Max Salary**
26	Identify **Top 5 industries with highest demand score**
27	Find **most frequently required skill using text analysis logic**
28	Analyze **whether remote jobs have higher salaries than on-site jobs**
29	Create **dynamic dashboard that updates with slicers (charts + KPIs)**
30	Final Business Insight: **Which country + role combination gives highest ROI (High salary + High demand)**
31	HR wants to **quickly identify and highlight TOP 10 highest salary jobs** in the dataset to prioritize premium hiring. Create a dynamic highlighting system that automatically updates when data changes.
32	Management needs a report showing **TOP 3 highest salaries for each Country** to understand regional salary trends. Output should dynamically update per country.
33	Build an **interactive Job Search Tool using Drop-down (Job ID)** where HR can select a Job ID and automatically fetch complete job details (title, salary, skills, location).
34	HR wants to simulate **salary increment scenarios (e.g., +10%, +20%)** and analyze impact on total salary budget. Build a What-If Analysis model.
35	Management requires that **all dashboards, pivots, and formulas automatically update** when new job data is added or existing data changes. Implement a fully automated system.
